

```

#include <iostream> // Header file for input and output
using namespace std;
// Class definition
class Sample
{
private:
    int a, b; // Private data members
public:
    // Constructor to initialize values
    Sample(int x, int y)
    {
        a = x; // Assign value to a
        b = y; // Assign value to b
    }
    // Friend function declaration
    friend void showData(Sample s);
};
// Friend function definition
void showData(Sample s)
{
    // Accessing private members of class
    cout << "Value of a = " << s.a << endl;
    cout << "Value of b = " << s.b << endl;
    cout << "Sum = " << (s.a + s.b) << endl;
}
// Main function
int main()
{
    // Create object of Sample class
    Sample obj(10, 20);
    // Call friend function
    showData(obj);
    return 0; // End of program
}

```

OUTPUT

```

Value of a = 10
Value of b = 20
Sum = 30

```
