

```

#include <iostream> // Header file for input and output
using namespace std;
// Class definition
class Calculator
{
private:
    float a, b; // Data members to store two numbers
public:
    // Function to accept values
#include <iostream> // Header file for input and output
using namespace std;
// Class definition
class Calculator
{
private:
    float a, b; // Data members to store two numbers
public:
    // Function to accept values
void getData(float x, float y)
{
    a = x; // Assign first number
    b = y; // Assign second number
}
// Inline function for addition
inline float add()
{
    return a + b;
}
// Inline function for subtraction
inline float subtract()
{
    return a - b;
}
// Inline function for multiplication
inline float multiply()
{
    return a * b;
}
// Inline function for division
inline float divide()
{
    return a / b;
}
};

```

```
// Main function
int main()
{
    Calculator calc; // Create object of Calculator class
    float x, y;
    // Accept input from user
    cout << "Enter two numbers: ";
    cin >> x >> y;
    // Pass values to object
    calc.getData(x, y);
    // Display results
    cout << "\nAddition = " << calc.add();
    cout << "\nSubtraction = " << calc.subtract();
    cout << "\nMultiplication = " << calc.multiply();
    cout << "\nDivision = " << calc.divide();
    return 0; // End of program
}
```

Output :

Enter two numbers: 20 10

Addition = 30

Subtraction = 10

Multiplication = 200

Division = 2
